

Hello! My name is Walter (they/them). I am a Wastewater Wizard and mascot of the DARROW project. Join me in exploring what the DARROW project is about.

# Making **wastewater treatment** more sustainable and efficient using a **data-driven AI solution**

**Save energy**

**Reduce Greenhouse Gas Emissions**

**Contribute to a circular economy**

**Reduce Waste**

How is wastewater actually treated?

The wastewater first passes through a **grit chamber** to remove heavy solids. Then, in **primary treatment**, large particles settle out. This is followed by **secondary treatment** where microbes break down organic matter. **Clarifiers** then separate remaining solids. The **sludge line** carries these solids to **anaerobic digestion** to produce biogas. Meanwhile, **UV disinfection** kills pathogens in the treated water before it is released into the environment.

DARROW's AI solution for optimising wastewater treatment consists of 3 layers.

01

Data augmentation and  
Data enrichment

02

Process control and  
Process recommendation

03

End user applications  
Digital twins and  
Real-time controllers

# Data augmentation

- Inflow prediction model
- Influent concentration prediction model
- Historical concentrations dataset

As a first step, we need data. Firstly, historical influent data.

Influent data

T-1	Today	T+1	T+2
☑	☑	🧠	🧠

# Data augmentation

- Inflow prediction model
- Influent concentration prediction model
- Historical concentrations dataset
- Gap filling model for lab data

Secondly, lab data. Note that lab data is not collected every day. No problem! AI can fill in the gaps.

Laboratory data

T-3	T-2	T-1	Today
			

# Data augmentation

Inflow prediction model

Influent concentration prediction model

Historical concentrations dataset

Gap filling model for lab data

**Anomaly detection model**

Thirdly, sensor data from the entire plant.

Sensor data

Sensor 1	Sensor 2	Sensor 3	Sensor 4
☑	☑	🚨	☑

# Data enrichment

Following data augmentation is data enrichment with the help of AI. Both on a big scale for the entire plant...

# Data enrichment

Plant status model

NH<sub>4</sub> software sensor

N<sub>2</sub>O software sensor

...as well as on a smaller scale for different sensors.

# Process control and recommendation

Secondary treatment  
RL model

Anaerobic digester  
RL model

Reinforcement learning (RL)  
for process control

Anaerobic digester  
ROM

Secondary treatment  
ROM

Reduced order models (ROM)  
for process recommendation

Plant-wide  
ROM

All the data feeds into the second layer:  
Process control using reinforcement learning  
and process recommendation using reduced  
order models

# End-user application

The DARROW tools will ultimately help plant operators **make better decisions.**
